01. CONSTANT HEAD PERMEAMETERS

STANDARDS: BS 1377:5 | ASTM D2434 | AASHTO T215

Introduction

Used to determine the permeability of granular, gravel and sand soils. The specimen is formed in an acrylic permeability cell, and water is passed through it from a constant level tank. The permeability cell has pressure points at different levels which are connected to the manometer tubes fixed on a stand with graduated scale.

See below for the main components and the feature required.

i. The constant head permeability cells

Diameter	: minimum 75 mm
Number of pressure take-off points	: minimum three
Made by	: Transparent acrylic plexiglass body or suitable material holding between two aluminium anodized end plates

ii. Manometer tubes and stand

Comprising three tubes of constant bore, graduated scale, tubing and connectors.

Stand Dimensions	: 210x50x1160 mm or appropriate
Weight	: 5 kg approximately or appropriate

iii. Constant level tank

The inlet, outlet and overflow pipes can be adjusted for height within the tank and capable of wall mounting.

Made by	: acrylic plexiglass, or suitable transparent material
Weight	: 3 kg approximately or appropriate

62 . CONSOLIDATION TEST APPARATUS

STANDARDS: ASTM D2435, D3877, D4546 I BS 1377:5 AASHTO T216 I XP P94 090-1, P94-091 UNE 103-405, 103-602

Introduction

The one-dimensional consolidation test, or oedometric test, provides information on the compressibility of a sample restrained laterally while subjected to vertical load. Loads are applied with progressive increases and the settlement values are read on a dial gauge or on a digital display (through a displacement transducer). The test can be performed in order to determine the correlation/ratio between the applied pressure and the resulting deformation, or between vertical deformation and time during which a constant pressure is applied. A cylindrical sample is inserted in a non-deformable metal ring and placed between two porous stones (to ensure water drainage and optimal amount of moisture).

The version required: manual application of weights

See below for the main components and the feature required

DD /

i. Consolidation cell

The consolidation cell should consist of the following components:

- Confining ring, placed circumferentially around the sample to restrict the lateral displacement
- Loading cap, to transfer the load to the soil specimen
- Reservoir, filled with water to ensure that the soil remains essentially saturated
- Porous stones, which are several orders of magnitude more permeable than typical samples of fine-grained soil. These stones enable the drainage of the water from the top and bottom of the specimen

ii. Loading frame

This configuration should compose of a loading beam and dead weights. The configuration allows for a constant load to be maintained indefinitely.

iii. Deformation measurements

The vertical deformation measurements of the soil specimen should perform using a dial gauge and it should consists minimum of 10 mm travel and 0.01 mm subdivision for vertical displacements.
